

Dispatch & Inventory Module

Feature Walkthrough & Functional Documentation

FederalMetalsRepo — Steel & Metals POS System
September 2026

What's covered in this document:

- **Dispatch Planning** — plan trips, drag & drop orders, live Google Map route, mileage/drive-time calculation, trip status updates, notes.
- **Dispatch Scheduled** — track trip status (Loaded, In Transit, Delivered, Cancelled), mark orders delivered/cancelled, live map, notes.
- **Dispatch Calendar** — weekly calendar view of all trips by truck/driver, status legend, create new trips directly from the calendar.
- **Inventory — Category Setup** — create a Plate/Sheet inventory type as a Category with sizing, image, tax, and delivery/pickup settings.
- **Inventory — Sub-Category Setup** — define Sub-Category under a Plate category with UOM, Max Length/Width, and custom sizing — feeds directly into the POS.
- **Manual PO Creation** — create manual purchase orders for Plate/Sheet products with vendor, pricing, and arrival date.
- **PO Receiving & Audit Trail** — view, receive, and edit purchase orders, with per-line-item detail and a full audit/history trail.

1. Dispatch Planning

Build outbound trips by dragging ready orders into a trip, with live route mapping.

What happens on this page:

- The left panel lists all **Ready for Delivery** orders, filterable by date range and zip code.
- Orders are added to a trip by **dragging and dropping** them from the ready list into the **Trips Planning** panel, or a brand-new trip can be started with **+ New Trip**.
- Each trip can be run with an **Internal Carrier** (assign Driver, Truck, Trailer, Start Time) or an **External Carrier**.
- As orders are added, the trip card auto-updates **Orders**, **Stops**, **Start Time**, and **Capacity/Weight** utilization.
- Selecting a trip opens **Trip Details** on the right with a live **Google Maps** view of the stop(s), plotted from the warehouse origin.
- The map automatically calculates and displays **Miles** and **Drive** time for the planned route once stops are set.
- Trip status (e.g. **Planning**) can be tracked and updated from this same panel as the trip moves forward.
- Action buttons let dispatch **Generate BOL**, **Print Invoice**, **Print Pick List**, **Add Notes** to the trip, **Mark Load**, or record **Departure**.

2. Dispatch Scheduled

Monitor trips already on the road and progress them through delivery status.

The screenshot displays the 'Dispatch Scheduled' interface. At the top, there's a navigation bar with 'Dispatch Planning', 'Dispatch Scheduled' (active), and 'Dispatch Calendar'. Below this is a 'Trip Status Overview' section with five cards: 'Planned Trips 0', 'Loaded 2' (highlighted), 'In Transit 2', 'Delivered 7', and 'Cancelled 1'. The main area is divided into 'Trips' and 'Map View'. The 'Trips' section lists two trips: 'TRP-2026-017' and 'TRP-2026-005'. The first trip is expanded, showing details like driver 'Kaif Test', carrier 'tata truck', date '08/18/2026', and a progress bar at 0%. It also lists a stop '2-ORDER-28612' with customer 'Yashi Test', company 'Yashi Company', address '1580 Sawgrass Corporate Parkway, Sunrise, Florida, 33323, United States', and weight '2.41 lbs'. Actions like 'Generate BOL', 'Print Invoice', 'Print Pick List', 'Add Notes', 'Departure', and 'Cancel Trip' are available. The 'Map View' section shows a Google Map with a 'Large View' button and a summary at the bottom: 'Total Stops 1', 'Completed 0', and 'Remaining 1'.

What happens on this page:

- A **Trip Status Overview** strip summarizes all trips at a glance: **Planned**, **Loaded**, **In Transit**, **Delivered**, and **Cancelled** counts.
- The **Trips** list below shows each trip with its carrier type, assigned driver/truck, date, and stop progress bar (e.g. 0/1 Stops).
- Expanding a trip reveals its **Stops**, each showing customer, company, delivery address, and weight, with a **Mark Delivered** checkbox per stop.
- Trip-level actions let dispatch **Generate BOL**, **Print Invoice**, **Print Pick List**, **Add Notes**, record **Departure**, or **Cancel Trip** — this is how a trip or order status is updated to Delivered/Cancelled.
- The **Map View** panel on the right plots all active stops live via **Google Maps**, with a **Large View** option for a bigger map.
- A **Total Stops / Completed / Remaining** counter at the bottom of the map tracks delivery progress for the selected trip in real time.

3. Dispatch Calendar

Weekly calendar view of all scheduled trips across trucks and drivers, with in-place trip creation.

What happens on this page:

- The calendar shows a **week-by-week grid** (with back/forward navigation) of trips scheduled per day.
- Rows can be toggled between a **Truck** view and a **Drivers** view, so dispatch can see availability from either angle.
- A color-coded **status legend** (Planning, Planned, Loaded, In Transit, Delivered, Cancelled) makes trip status visible directly on the calendar at a glance.
- Clicking the **+** on any truck/day cell opens the **Create Trip** dialog directly from the calendar — no need to go back to Dispatch Planning.
- The Create Trip dialog captures **Trip Name, Date, Driver, Truck, Trailer, and Start Time** before the trip is added to the schedule.
- This page gives dispatch a single view of **fleet load and driver assignments** for the week, so new trips can be slotted into open capacity.

4. Inventory Setup — Add New Category (Plate / Sheet)

Define a Plate/Sheet product category with display, tax, and sizing rules that will flow through to the POS.

Add New Category Add field

Do you offer? ☐ Only Delivery ☒ Only Pickup ☐ Both Delivery & Pickup

Inventory Info

Inventory Type*

Select Inventory Type

Select Inventory Type

Regular Inventory

Coil

Plate / Sheet

Sale UOM*

Select UOM

Available Sizes*

Select Size

Custom Sizes : ☐ DISABLE

What happens on this page:

- Under **Details**, a category **Name**, **Description**, and an optional category **Image** are entered.
- Under **Settings**, the category is configured with **Display Priority**, whether it should **Include Image**, be **Public**, **Consumable**, **Taxable**, and whether an **Additional Fee** applies.
- The **Do you offer?** option sets fulfillment type: **Only Delivery**, **Only Pickup**, or **Both Delivery & Pickup**.
- Under **Inventory Info**, the key step for this workflow is selecting **Inventory Type = Plate / Sheet** (alongside Regular Inventory and Coil options) — this tells the system the category will be sized in 2D (length × width / square footage) rather than by simple quantity.
- **Sale UOM** and **Available Sizes** are set for the category, with a **Custom Sizes** toggle to allow non-standard dimensions.
- Once saved, this category becomes the parent under which Plate-type Sub-Categories and Products are created.

5. Inventory Setup — Add New Sub-Category (Plate / Sheet)

Define Plate sizing rules (UOM, Max Length/Width) at the sub-category level, feeding directly into the POS.

Sub Category Home / TEST PLATE CAT 16 JUL / Add New Sub Category

Add New Sub Category in **TEST PLATE CAT 16 JUL** Category Add field

Inventory Info

Inventory Type* Plate / Sheet

Purchase UOM* CWT

Max Length (in)* 10.00

Max Width (in)*

Custom Sizes : ENABLE

What happens on this page:

- This screen is reached from a Plate category (here, **TEST PLATE CAT 16 JUL**) via **Add New Sub Category**, keeping the sub-category scoped to its parent category.
- **Details** capture the Sub-Category **Name**, **Description**, and an optional image, same as the category level.
- **Settings** control whether the sub-category is **Public**, **Consumable**, **Taxable**, and whether an **Additional Fee** applies.
- **Inventory Type** is inherited/confirmed as **Plate / Sheet**, which unlocks the plate-specific fields below it.
- **Purchase UOM** (e.g. **CWT**) sets the unit purchasing is costed in, while **Max Length (in)** and **Max Width (in)** cap the sheet dimensions allowed for products under this sub-category.
- The **Custom Sizes** toggle (Enable/Disable) allows individual products to define sizes outside the standard set.
- Once configured, these plate products become sellable from the **POS**, where staff can select thickness, length, and width against these limits at the register.

6. Manual PO — Create Plate/Sheet Purchase Order

Raise a manual purchase order for Plate/Sheet inventory with product, vendor, and pricing detail.

Create Manual PO

2-PO-820-05-2026	05-15-2026	Varsteel	1	

What happens on this page:

- The **Create Manual PO** dialog auto-generates an **Internal PO** number and accepts an optional **External PO** reference from the vendor.
- **Inventory Type** is set to **Plate/Sheet**, switching the product grid into plate-specific columns.
- The **Add Product Details** grid captures **Category**, **Sub-Category**, **Product**, **Coating Type**, **Thickness (in)**, **Weight/sq ft**, **Width (inch)**, **Length (in)**, **Weight/sheet**, and **\$ CWT** — all the dimensional data set up at the category/sub-category stage.
- **Select Vendor**, **Vendor Tax**, and **Arrival Date** complete the order header before saving.
- Behind the dialog, the existing **PO list** shows previously created orders (e.g. **2-PO-805-08-2025**, **2-PO-814-05-2026**) with vendor and item counts, each with **View** and **Edit** actions.
- Saving the PO adds it to this list in **pending/expected** status until it is received.

7. Purchase Orders — Receiving, Line-Item Detail & Audit Trail

Review, edit, and receive plate purchase orders, with a full history/audit trail per line item.

Showing 26 to 50 of 50 entries

Previous

1

2

Next

Received

What happens on this page:

- The main table lists all POs with **PO number**, **Vendor**, **item count**, and **Expected Arrival Date**, paginated (e.g. **Showing 26 to 50 of 50 entries**).
- Each row has **Download**, **View**, and **Edit** icons so any PO created in the Manual PO screen can be revisited and corrected.
- Expanding a PO (e.g. **2-PO-864-07-2026**) reveals its **plate line-item detail**: Product, Thickness(in), Length(in), Width(inch), Weight, Price/CWT, Sheet Price, Price/Sq.Ft, Sq.Ft, Plate #, Coating Type, and Expected Arrival Date.
- Each line item shows an **Open** status and has its own action icons — **Download**, **View**, **Edit**, and a **History/Audit Trail** icon — so every change to price, quantity, or dimensions on that specific plate line is tracked.
- The **Received** button at the bottom of the expanded PO marks the purchase order (or selected line items via the checkboxes) as received into inventory.
- This combination of edit access plus per-line audit history gives full traceability on every plate PO from creation through receiving.
